

Liveness:

```
spin -a file
gcc -o pan pan.c
pan -a -f or ./pan -a -f
spin -t -p -l -g -r -s file
```

Spin arguments

```
-a generate verifier and syntax check
-i interactive simulation
-I display Promela program after preprocessing
-nN seed for random simulation
-t guided simulation with trail
-tN guided simulation with Nth trail
-uN maximum number of steps is N

-f translate an LTL formula into a never claim
-F translate an LTL formula in a file into a never claim
-N include never claim from a file

-l display local variables
-g display global variables
-p display statements
-r display receive events
-s display send events
```

Compile arguments

```
-DBFS breadth-first search
-DNP enable detection of non-progress cycles
-DSAFETY optimize for safety

-DBITSTATE bitstate hashing
-DCOLLAPSE collapse compression
-DHC hash-compact compression
-DMA=n minimized DFA with maximum n bytes
-DMEMLIM=N use up to N megabytes of memory
```

Pan arguments

```
-a find acceptance cycles
-f weak fairness
-l find non-progress cycles
```

```
-cN stop after Nth error
-c0 report all errors
-e create trails for all errors
-i search for shortest path to error
-I approximate search for shortest path to error
-mN maximum search depth is N
-wN 2N hash table entries

-A suppress reporting of assertion violations
-E suppress reporting of invalid end states
```

Caveats

- Expressions must be side-effect free.
- Local variable declarations always take effect at the beginning of a process.
- A `true` guard can always be selected; an `else` guard is selected only if all others are false.
- Macros and `inline` do *not* create a new scope.
- Place labels before an `if` or `do`, *not* before a guard.
- In an `if` or `do` statement, interleaving can occur between a guard and the following statement.
- Processes are activated and die in LIFO order.
- Atomic propositions in LTL formulas must be identifiers starting with lowercase letters and must be boolean variables or symbols for boolean-valued expressions.
- Arrays of `bit` or `bool` are stored in bytes.
- The type of a message field of a channel cannot be an array; it can be a `typedef` that contains an array.
- The functions `empty` and `full` cannot be negated.

Datatypes

```
bit (1 bit)
bool (1 bit)
byte (8 bits unsigned)
short (16* bits signed)
int (32* bits signed)
unsigned (<= 32* bits unsigned)
    * - for a 32-bit machine.

pid
chan
mtype = { name, name, ... } (8 bits)
typedef typename { sequence of declarations }
```

Declaration - type var [= initial value]

Default initial values are zero.

Array declaration - type var[N] [= initial value]

Array initial value assigned to all elements.

Operators (descending precedence)

```
() [] .
! ~ ++ --
* / %
+ -
<< >>
< <= > >=
== !=
&
^
```

```
|
&&
||
( ... -> ... : ... ) conditional expression
=
```

Predefined

Constants - true, false

Variables (read-only except _):

- _ - write-only hidden scratch variable
- _nr_pr - number of processes
- _pid - instantiation number of executing process
- timeout - no executable statements in the system?

Preprocessor

```
#define name (arguments) string
#undef, #if, #ifdef, #ifndef, #else, #endif
#include "file name"
inline name (arguments) { ... }
```

Statements

Assignment - var = expression, var++, var--
assert(expression)

printf, printm - print to standard output
%c (character), %d (decimal), %e (mtype),
%o (octal), %u (unsigned), %x (hex)
scanf - read from standard input in simulation mode

skip - no operation
break - exit from innermost do loop
goto - jump to label

Label prefixes with a special meaning:

- accept - accept cycle
- end - valid end state
- progress - non-progress cycle

atomic { ... } - execute without interleaving
d_step { ... } - execute deterministically (no jumping in or out; deterministic choice among true guards; only the first statement can block).

{ ... } unless { ... } - exception handling.

Guarded commands

```
if :: guard -> statements :: ... fi
do :: guard -> statements :: ... od
else guard - executed if all others are false.
```

Processes

Declaration - proctype procname (parameters) { ... }
Activate with prefixes - active or active[N]
Explicit process activation - run procname (arguments)
Initial process - init { ... }
Declaration suffixes:
priority - set simulation priority
provided (e) - executable only if expression e is true

Channels

chan ch = [capacity] of { type, type, ... }

```
ch ! args      send
ch !! args     sorted send
```

```
ch ? args      receive and remove if first message matches
ch ?? args     receive and remove if any message matches
ch ? <args>    receive if first message matches
ch ?? <args>   receive if any message matches
ch ? [args]    poll first message (side-effect free)
ch ?? [args]   poll any message (side-effect free)
```

Matching in a receive statement: constants and mtype symbols must match; variables are assigned the values in the message; eval(expression) forces a match with the current value of the expression.

len(ch) - number of messages in a channel
empty(ch) / nempty(ch) - is channel empty / not empty?
full(ch) / nfull(ch) - is channel full / not full?

Channel use assertions:

```
xr ch - channel ch is receive-only in this process
xs ch - channel ch is send-only in this process
```

Temporal logic

!	not
&&	and
	or
->	implies
<->	equivalent to
[]	always
<>	eventually
X	next
U	strong until
V	dual of U defined as pVq <-> !(pU!q)

Remote references

Test the control state or the value of a variable:
process-name @ label-name
proctype-name [expression] @ label-name
process-name : label-name
proctype-name [expression] : label-name

Never claim

never { ... }.

Predefined constructs that can only appear in a never claim:

- _last - last process to execute
- enabled(p) - is process enabled?
- np_ - true if no process is at a progress label
- pc_value(p) - current control state of process
- remote references

See also trace and notrace.

Variable declaration prefixes

hidden - hide this variable from the system state
local - a global variable is accessed only by one process
show - track variable in Xspin message sequence charts

Verification

Safety:

```
spin -a file
gcc -DSAFETY -o pan pan.c
pan or ./pan
spin -t -p -l -g -r -s file
```
